TITLE: Integrating digital watermarks in multimedia content

----- KWIC -----

Detail Description Paragraph - DETX (31): [0050] To verify authenticity, the application at the decoder side repeats the process of extracting the features from the received media types (e.g., 44, 46), hashing these features, and then comparing the new hash with the hash extracted from the watermark message or messages. The objective of the hash is to create a content dependent parameter that may be inserted into a watermark message, or in some cases, in metadata associated with a media signal. The hash is not necessary if the size of the extracted features is such that they fit within a message
